SHOPPERS · JAN 2024 – JUN 2026

Performance analysis

Revenue counts only completed, paid orders. 49,665 orders were analysed in total.

How much did the shop make?

The shop earned **R2,977,413** from **42,526** completed, paid orders. The average order is worth about **R70**.

BUSINESS RECOMMENDATION

Test relevant product bundles to raise the R70 average order value; track profit per order before expanding.

Is revenue growing, shrinking or flat?

Revenue was **flat** at roughly R95k–R114k a month through January 2026, with small peaks in March, July, May and November. From February 2026 it **drops by about a third** to ~R70k a month — worth investigating.

BUSINESS RECOMMENDATION

Check data completeness, stock availability and order volumes from February 2026 before changing marketing spend; confirm seasonal peaks across years.

Monthly revenue (completed, paid orders)

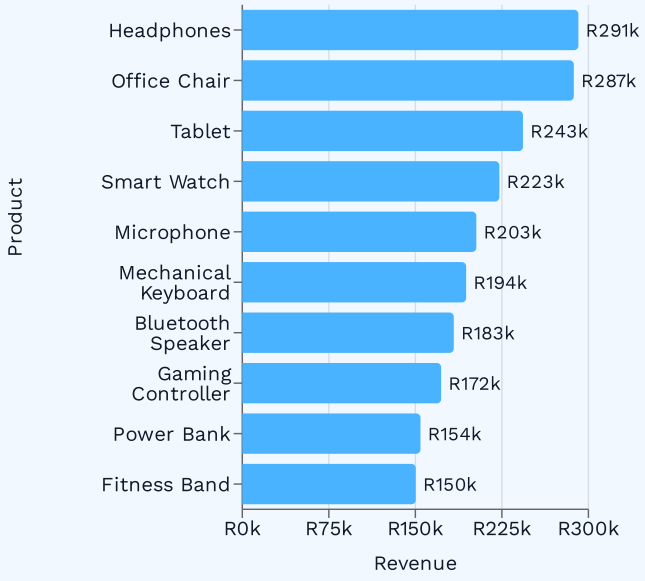

Which products and categories lead?

No, they are not the same. **Headphones, Office Chairs and Tablets** earn the most, while cheap items like **Notebooks, Phone Cases and USB-C Cables** sell the most units. Electronics brings in half of all revenue; Accessories sells slightly more units but earns a third as much.

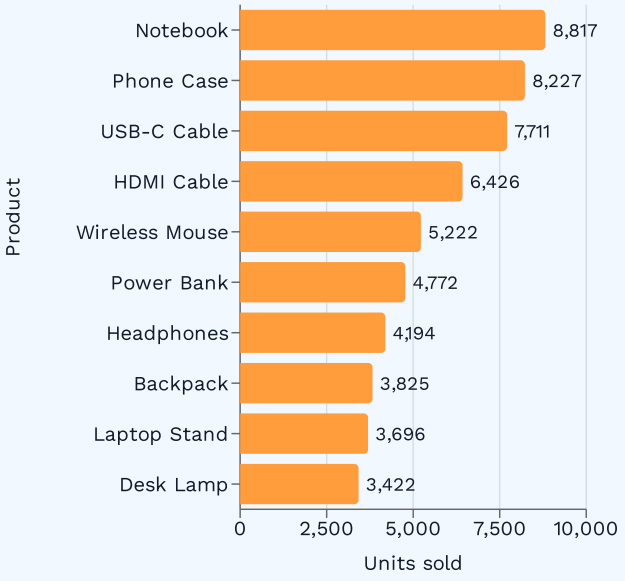

BUSINESS RECOMMENDATION

Prioritise stock for Headphones, Office Chairs and Tablets; test compatible accessory add-ons and check margins before increasing promotion.

Which cities and segments are most valuable?

Tehran is by far the biggest market at R820k — more than twice Mashhad. By segment, **Regular** customers bring in the most revenue. Average order value is almost identical everywhere (~R70), so value comes from the number of orders, not bigger baskets. VIPs spend no more per order than others.

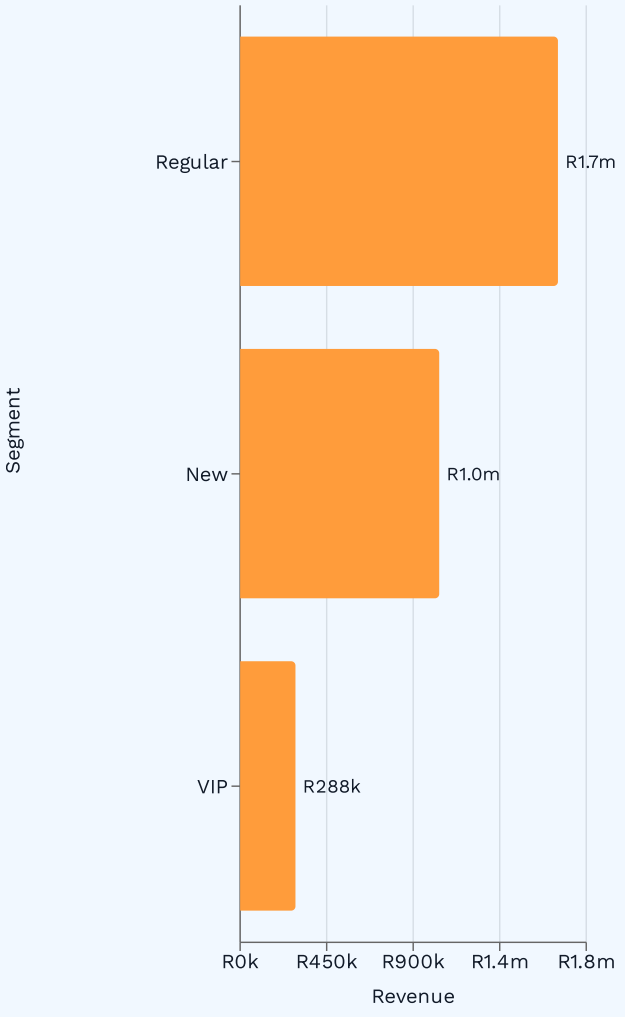

BUSINESS RECOMMENDATION

Focus retention campaigns on Regular customers and reliable delivery in Tehran; assess VIP repeat purchases before offering extra perks.

Revenue by city

Revenue by customer segment

How many orders and payments go wrong?

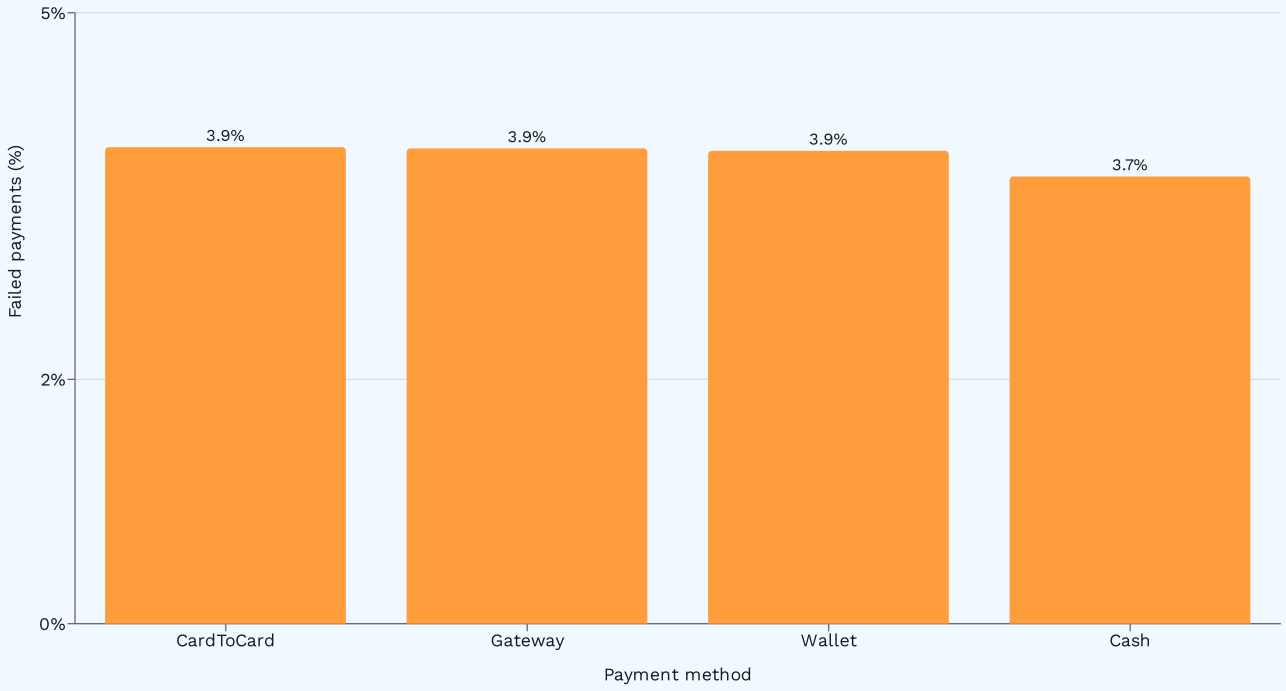

4.9% of orders are cancelled and **3.1%** returned — about 8% in total. **3.9%** of payments fail. Failure rates are very similar across methods (3.7%–3.9%); Cash fails slightly less often, but no method stands out as a problem.

BUSINESS RECOMMENDATION

Record cancellation and return reasons, then address the most common causes; offer payment retries rather than removing methods with similar failure rates.

CANCELLED ORDERS	RETURNED ORDERS	FAILED PAYMENTS
4.9%	3.1%	3.9%

Payment failure rate by method

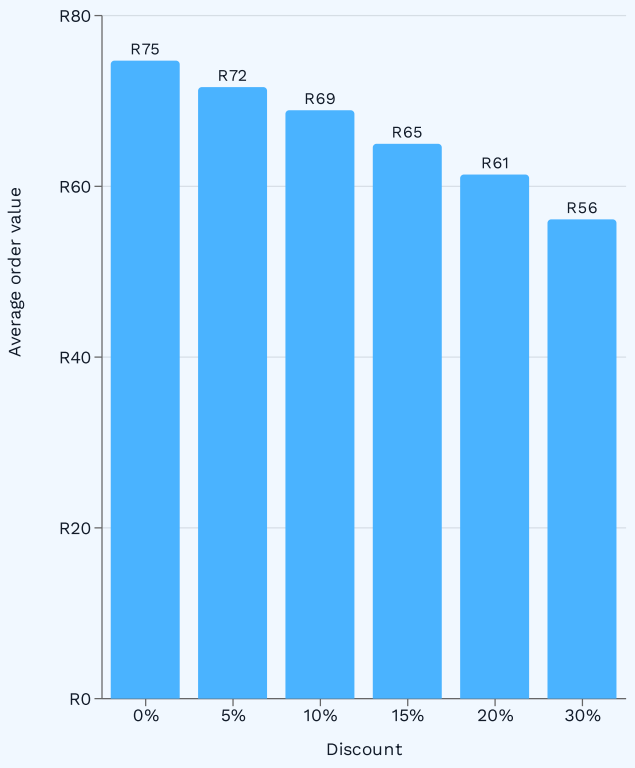

Do bigger discounts lead to bigger orders?

No — just lower revenue. Customers buy about 1.9 items per order whatever the discount. So the average order falls steadily from R75 at no discount to R56 at 30% off.

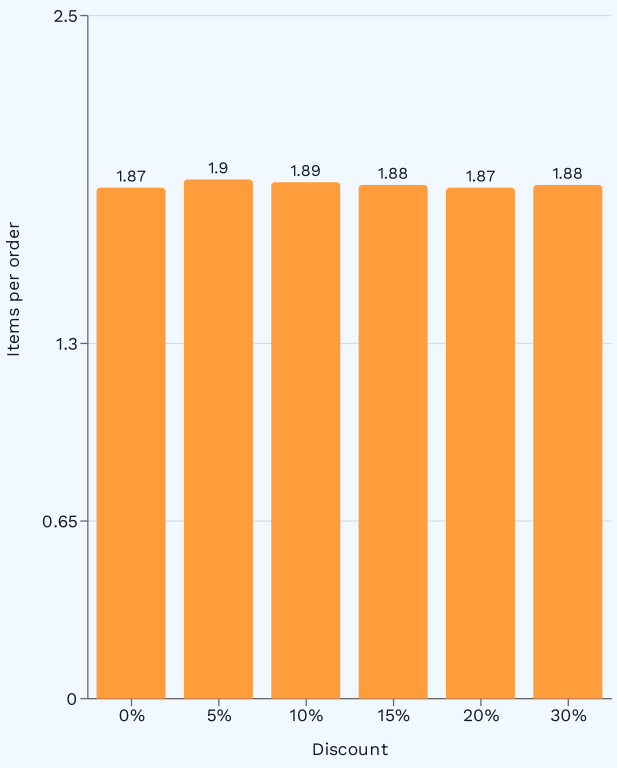

BUSINESS RECOMMENDATION

Avoid blanket deep discounts; test targeted offers against a no-discount group and retain only those that increase total profit.

Average order value by discount level

Average items per order by discount level

In summary

The shop is **steady, not growing**. It has earned R3.0m from **42,526** paid orders, but monthly revenue has held at the same level for two years and fell by about a third from February 2026.

Deeper discounts will not fix that — customers buy the same basket at every discount level. Growth has to come from a higher average order value, keeping Regular customers and Tehran deliveries reliable, and cutting the 8% of orders that are cancelled or returned.

NEXT STEPS

1. Find out why revenue dropped from February 2026 before spending more on marketing or discounts.
2. Test bundles and add-ons to lift the R70 average order value instead of deepening discounts.
3. Record why orders are cancelled or returned, then fix the most common cause.
